AI SEARCH VISIBILITY · 2026

Visibility

Buyers stopped scrolling search results and started asking AI. I designed the product that shows a brand where it stands in those answers, and what to publish next.

ROLE

Senior Product Designer

TEAM

2 product designers

SCOPE

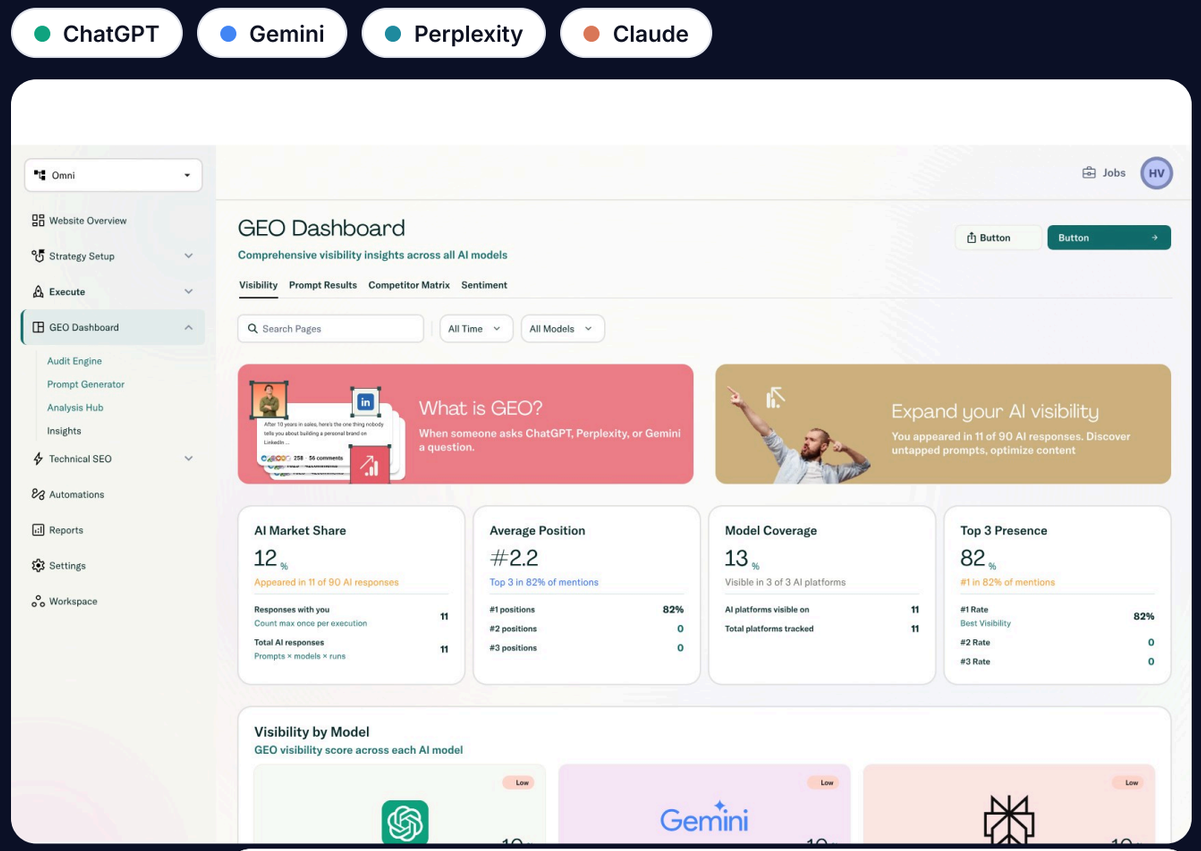

End-to-end product UX & UI, onboarding

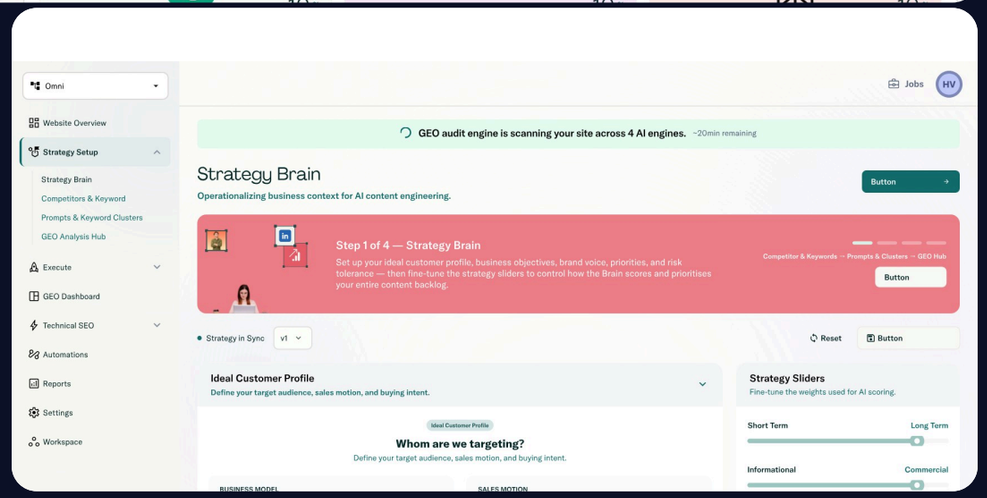

PLATFORM

Web app

OUTCOME

$3M ARR in 60 days*

*Pixis press release, 30 Jun 2026.

When buyers ask AI, most brands can't tell if they're in the answer.

THEN · GOOGLE

Ten links, and a rank you can track.

Buyers search, scan the results and click. SEO tools tell a brand exactly where it ranks.

NOW · AI ASSISTANTS

One answer that names a few brands.

Buyers ask a question and trust the shortlist. A brand has no way of knowing whether it was named, or why a competitor was picked instead.

EXAMPLE

Which B2B marketing agency should we hire for SEO?

Here are three agencies teams often recommend:

1. Competitor A
2. Competitor B
3. Competitor C

Your brand: not mentioned, and you'd never know.

Illustration of a typical AI answer.

THE PROBLEM I SET OUT TO SOLVE

Help a brand see where it shows up in AI answers, why competitors get picked instead, and what to publish to change that.

35% **use AI to discover products**, vs 13.6% who start with search.
Similarweb

~1% **click a cited source.** The answer is the destination.
Pew Research, 2025

−68% **paid CTR** where Google shows an AI answer.
Seer Interactive, 2025

Teams couldn't see it. And when they could, they couldn't act on it.

MEASUREMENT

45%

of marketing leaders can't accurately measure their AI visibility.

9%

have the tools to track all the metrics that matter.

Semrush AI Visibility Index, 2026

THE LANDSCAPE

SEO suites

Track Google rankings and backlinks. Don't see AI answers.

AI trackers

Show the gap. Stop at the dashboard.

The missing step

From insight to a live page, in one workflow.

How Pixis frames the market on its product page

WHAT TEAMS SAID

"The pipeline from insight to live page was where everything stalled."

CEO, CUSTOMER

"We're not exporting across five tabs just to brief a single article."

DIRECTOR OF SEO, CUSTOMER

"The hard part of AI search was proving to clients it mattered, then actually moving the needle."

AGENCY FOUNDER, CUSTOMER

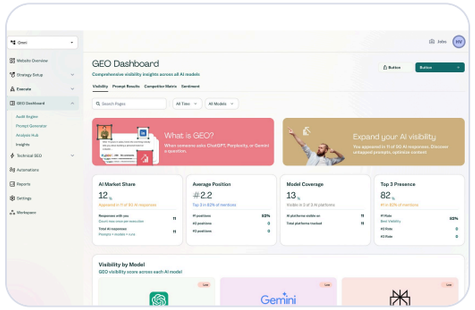

Quotes from the Pixis launch release and Visibility customer testimonials.

Four things the product had to get right.

01

AI answers change every time you ask.

One snapshot can't be trusted. The same prompt can name you today and skip you tomorrow, and each engine behaves differently.

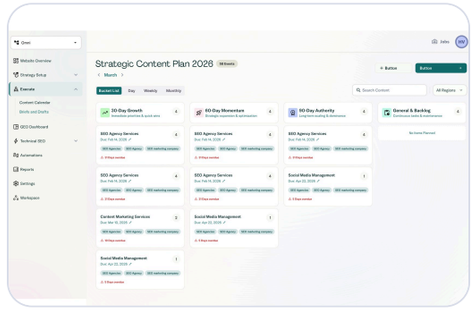

SO VISIBILITY

shows presence run by run, per engine and per prompt.

02

An insight that doesn't ship is just a report.

Teams already had data. Where they stalled was turning a gap into a page that gets published.

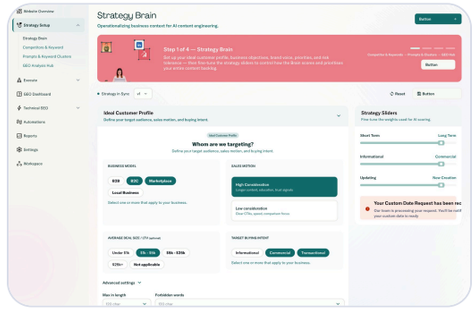

SO VISIBILITY

ends every gap in a brief, a calendar slot or a fix.

03

Generated content is only as good as its context.

Without the audience, offer and voice, AI writes generic pages that no engine has a reason to cite.

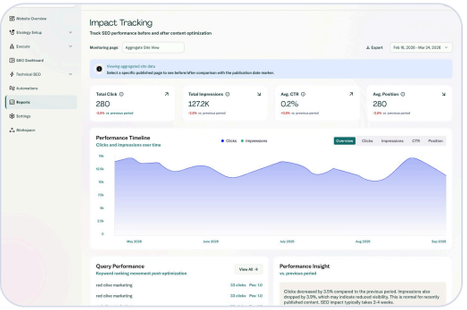

SO VISIBILITY

asks for the business context first, in a Strategy Brain.

04

Agencies have to prove it to clients.

Agencies run AI search for several clients at once, and each client wants proof that it moved the needle.

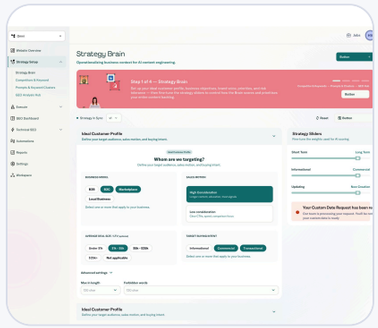

SO VISIBILITY

gives workspaces per brand and before-and-after reports.

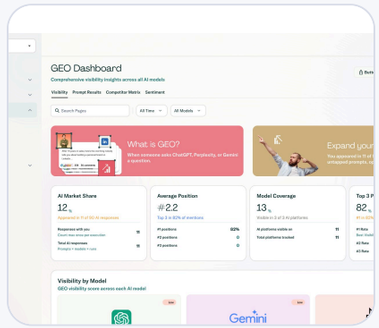

SEO and GEO in one loop.

I organised the product around the job, not the data source: plan, measure, fix, create, amplify and prove. One sidebar takes you around the loop.

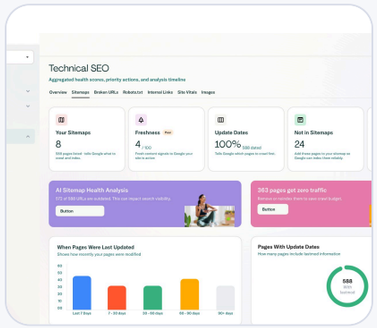

01 PLAN

Strategy Brain, competitors, prompts

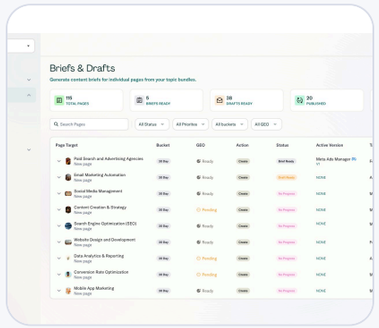

02 MEASURE

GEO audits and the dashboard

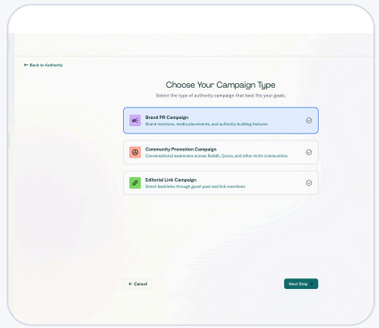

03 FIX

Technical SEO audit and issues

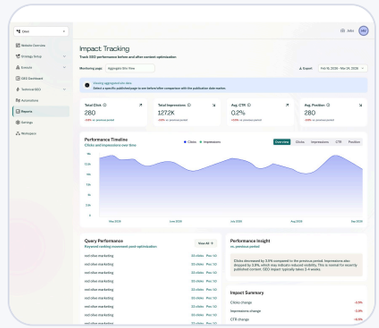

04 CREATE

Calendar, briefs and drafts

05 AMPLIFY

PR, backlinks, community

06 PROVE

Reports and automations

4

AI engines tracked: ChatGPT, Gemini, Perplexity and Claude

60+

pages in the GEO intelligence report from a first audit

50+

buyer prompts tested, with position and competitor mapping

30/60/90

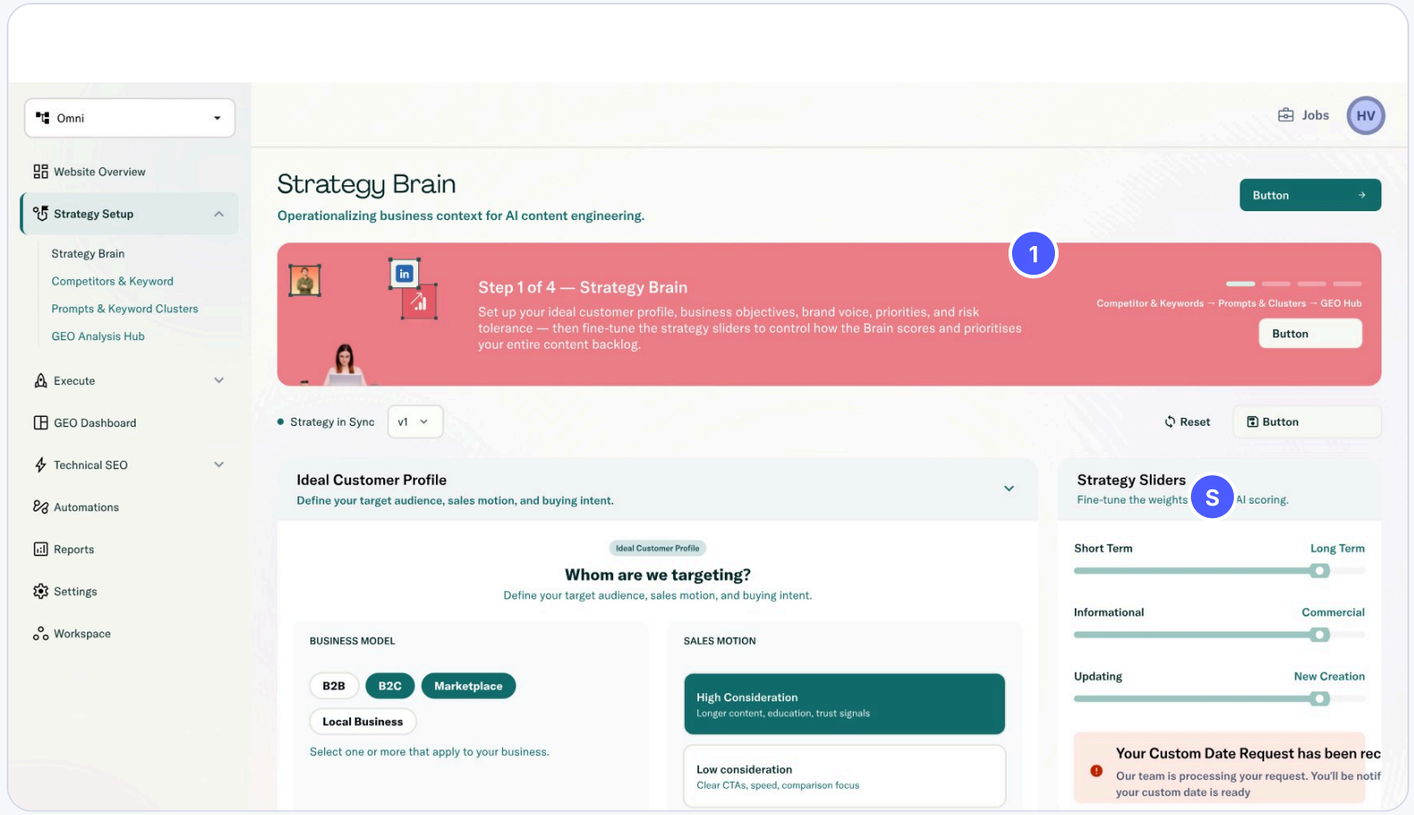

day content calendars, publishable to a CMS

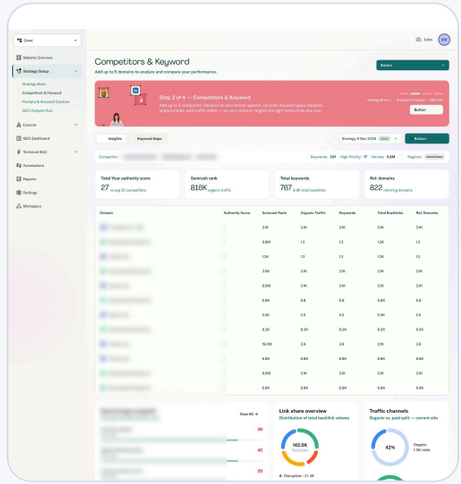

DECISION 01

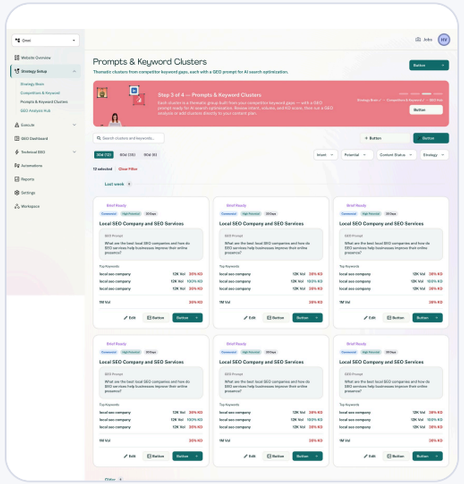

Teach the brain before it writes.

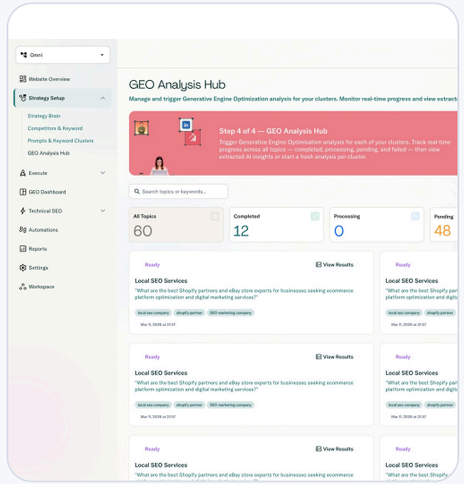

Setup is four guided steps, each building on the last. By the end, every score and every draft knows who the buyer is, what the business wants and how the brand sounds.

1. **Strategy Brain**
   Customer profile, objectives, voice, risk tolerance
2. **Competitors & keywords**
   Up to five domains to benchmark against
3. **Prompts & clusters**
   The questions buyers actually ask AI
4. **GEO Analysis Hub**
   Run the prompts across engines, see results

S · Strategy sliders tune how the Brain scores the content backlog: short vs long term, informational vs commercial.

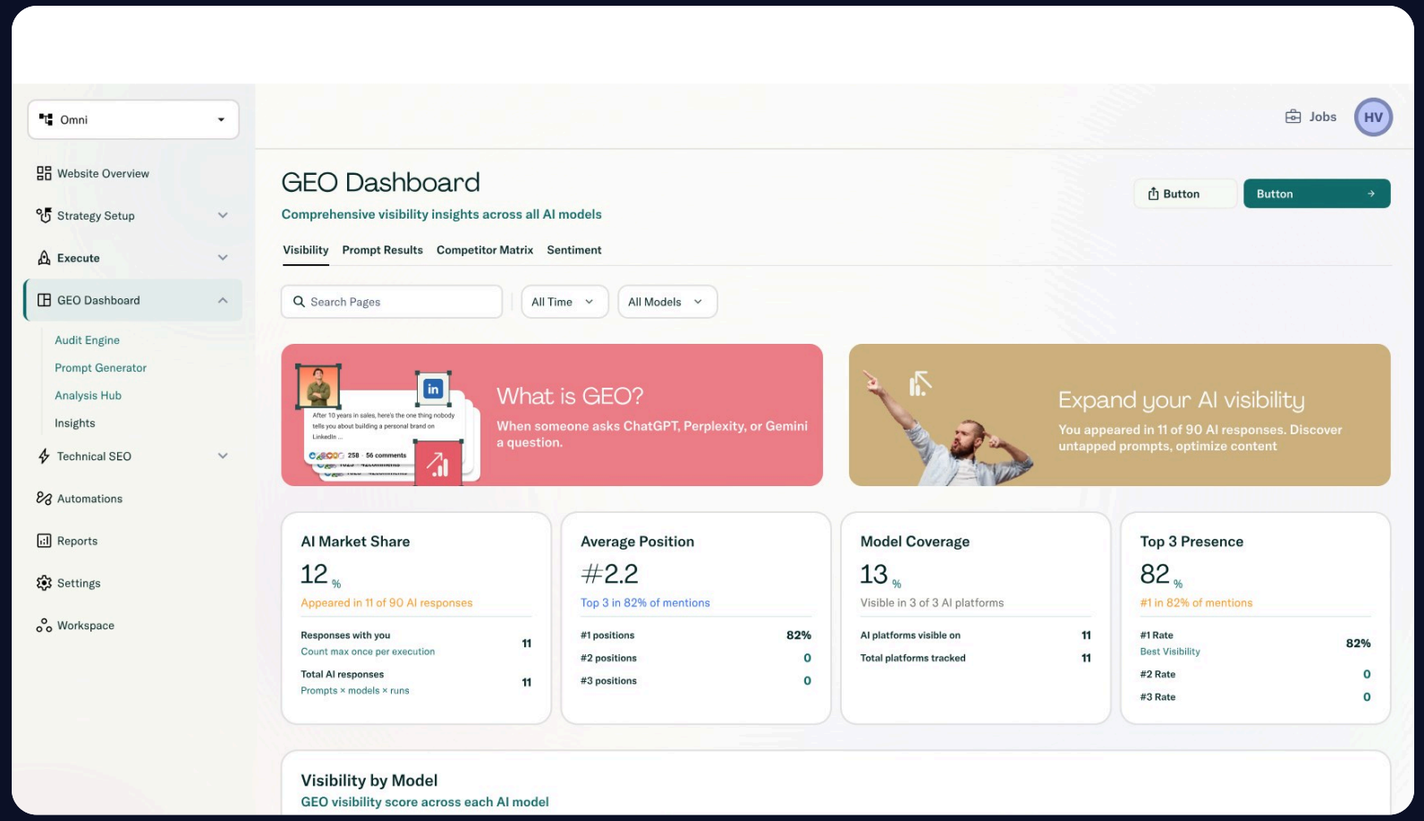

DECISION 02

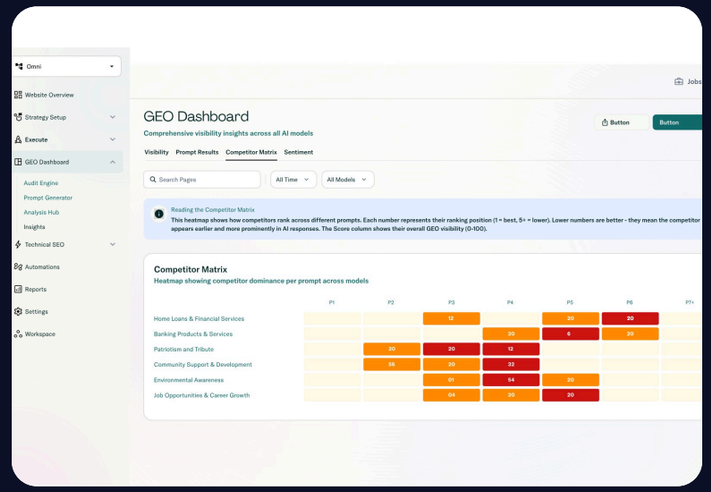

Turn thousands of answers into four numbers.

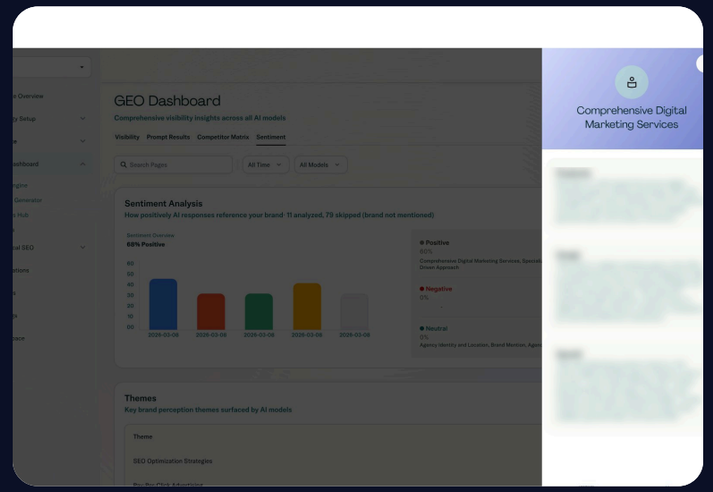

Every run produces a wall of AI responses. The dashboard leads with four questions a marketer actually asks, in plain counts, then lets them drill into prompts, competitors and sentiment.

MARKET SHARE	"Appeared in 11 of 90 AI responses"
POSITION	Where you rank when you are mentioned
COVERAGE	"Visible in 3 of 3 AI platforms"
TOP-3 PRESENCE	How often you make the shortlist

Figures shown are sample data from the design file.

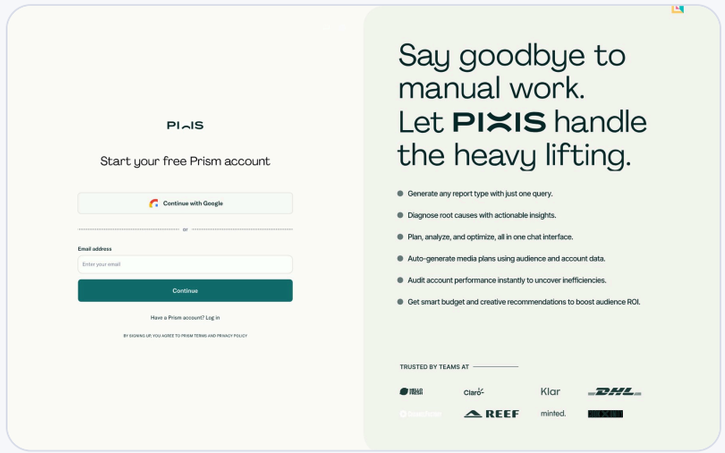

Competitor heatmap per prompt · how each engine describes the brand (blurred)

The first audit takes time. I made the wait worth it.

ROUND 1

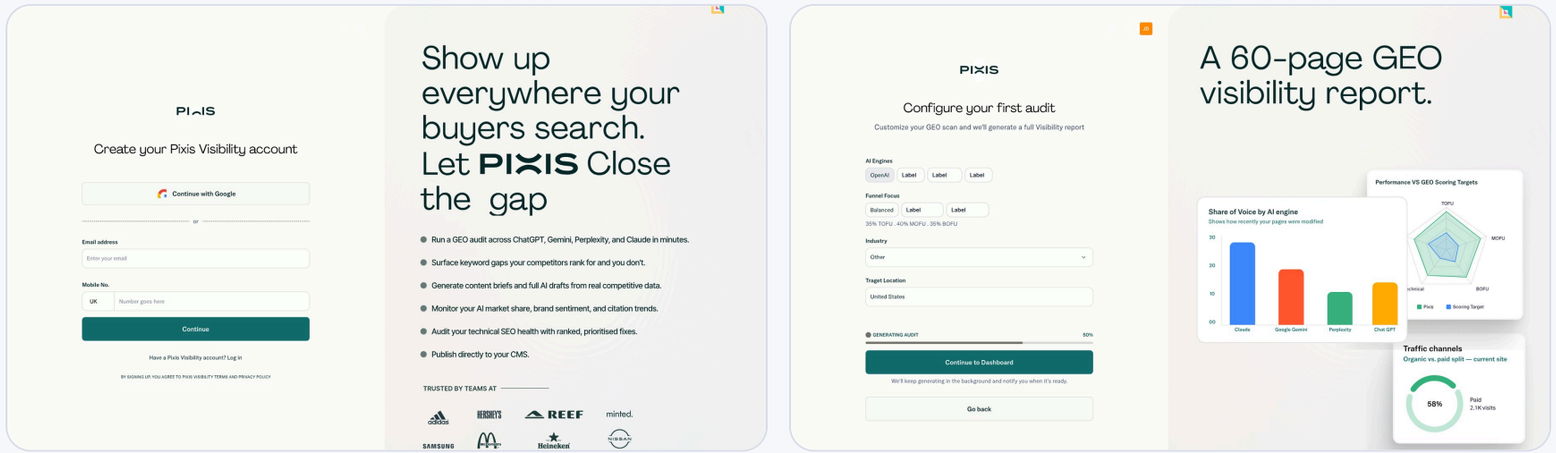

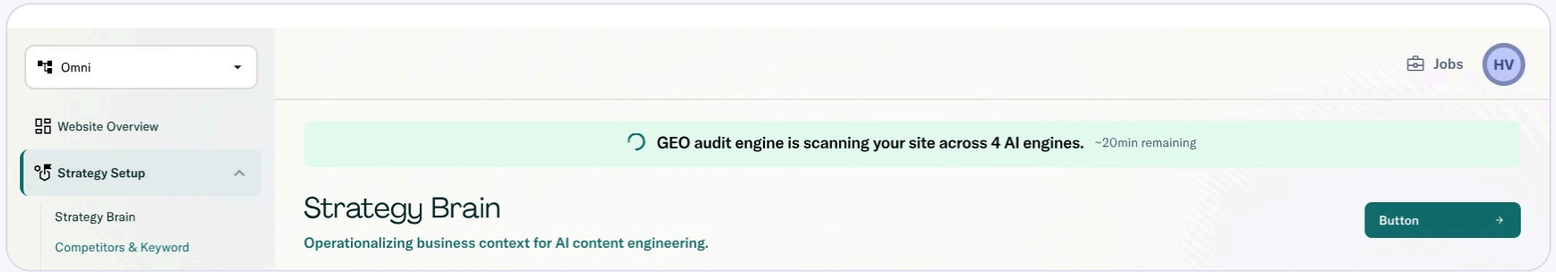

Signup borrowed Prism's account and pitch: "Say goodbye to manual work." Nothing told a new user what Visibility would show them, and the audit ran behind a blank wait.

WHY IT NEEDED A REDESIGN

"We are making them wait, but not giving them any reason to care during that time."

FINAL

1

Its own promise

"Show up everywhere your buyers search." A Visibility account, not a Prism one.

2

A preview of the payoff

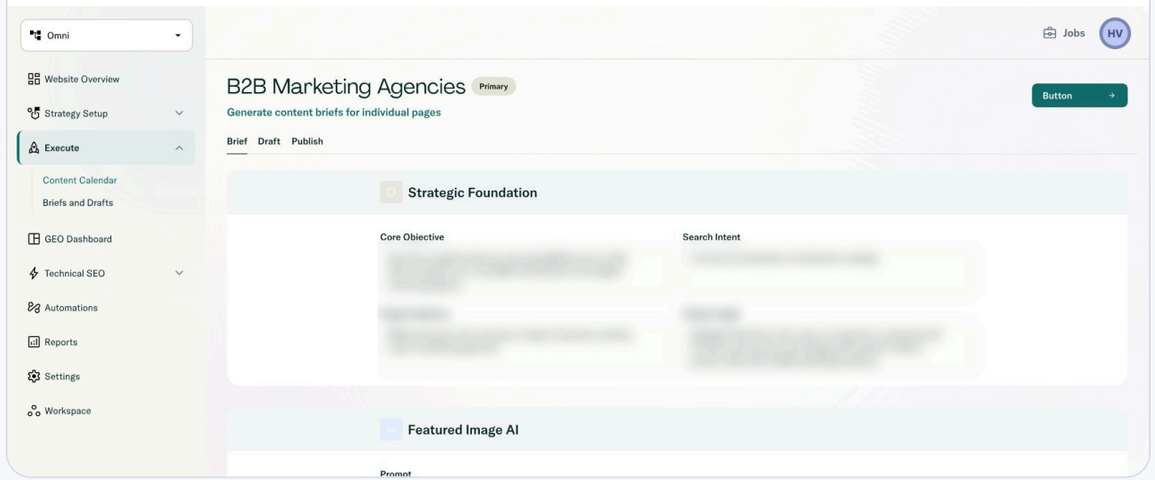

While the audit runs, the screen walks through the 60-page report it is building.

3

Useful while it runs

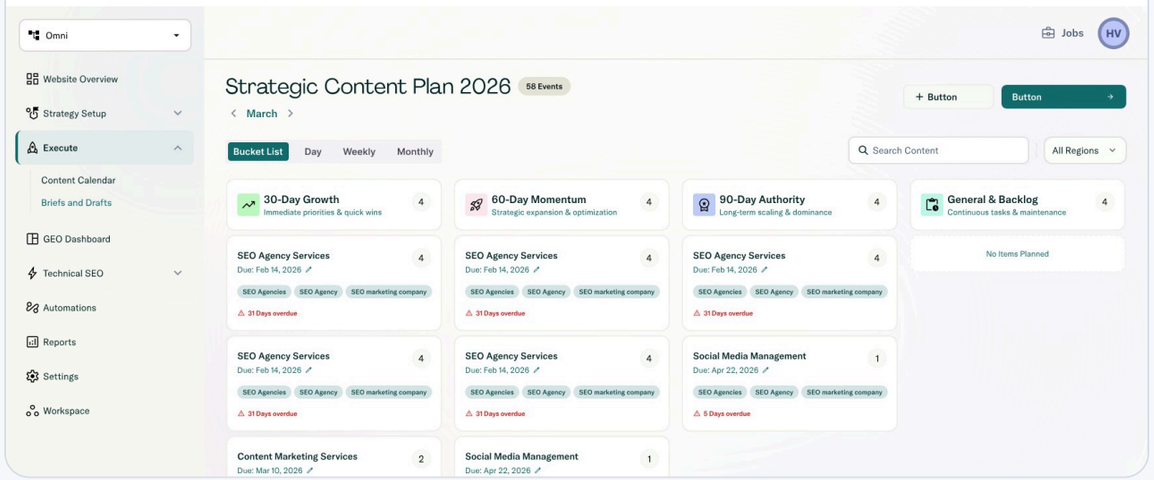

The scan continues in the background while you set up your strategy.

Every gap ends in something you can publish.

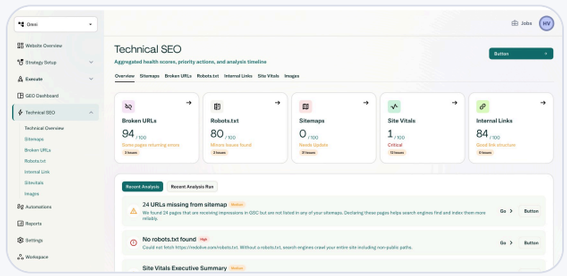

Briefs from topic bundles

Each brief starts from objective, intent, audience and angle, then moves from brief to draft to publish in one place.

A content calendar, not a to-do list

Recommended pages land on a plan, and teams can add the content they already had scheduled.

Technical fixes

Ranked issues with an AI summary

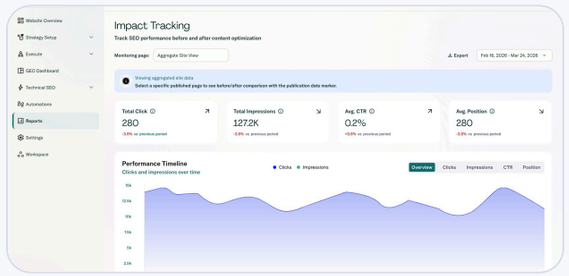

Authority campaigns

PR, community and editorial links

Automations

Scheduled pipelines and Slack alerts

Before / after

Performance around each publish date

The fastest-growing product in the Pixis suite.

REVENUE

$3M in annual recurring revenue within 60 days of launch.

Pixis press release, 30 Jun 2026

PIXIS USED VISIBILITY ON ITSELF

18→62%
AI visibility on tracked prompts

24 of 26
published pieces cited by AI engines

+35%
impressions, with clicks up 25%

"Instead of guessing at AEO, my team has a clear list of what to fix and publish."

DIRECTOR OF SEO, CUSTOMER

Self-test figures: Pixis LinkedIn post, 2026. Timeframe not stated.

IF I DID IT AGAIN

Test the metric names with users first.

"Market share", "coverage" and "presence" are close cousins. I would validate how people read them before building the dashboard around them.

WHAT I LEARNED

A score needs a next step.
Numbers alone stall. Linking every gap to a brief or fix is what made the dashboard worth opening.

Context in, quality out.
Asking for the business context up front costs a few minutes and saves every draft after it.

Show the variance.
AI answers move. Run-by-run views build more trust than one confident number.

A wait is a first impression.
The first audit is a new user's first real moment with the product. Previewing the report turns dead time into a look at what's coming.

FUTURE SCOPE

Show why an engine skipped you.
Link each missed prompt to the pages and sources the engine cited instead.
